Aimed at the undergraduate level,  
this work is appropriate either as  
part of a two-term International  
sequence (trade and finance), or in  
advanced courses in Trade that  
follow a one-term International  
Economics course. It can also be

used as a background text for beginning graduate courses. Intermediate Microeconomics is a pre-requisite.

## Table of contents

An excellent introduction to feedback control system design, this book offers a theoretical approach that captures the essential issues and can be applied to a wide range of practical problems. Its explorations of recent developments in the field emphasize the relationship of new procedures to classical control theory, with a focus on single input and output systems that keeps concepts accessible to students with limited backgrounds. The text is geared toward a single-

senior course or a graduate-level class for students of electrical engineering. The opening chapters constitute a basic treatment of feedback design.

Topics include a detailed formulation of the control design program, the fundamental issue of performance/stability robustness tradeoff, and the graphical design technique of loopshaping.

Subsequent chapters extend the discussion of the loopshaping technique and connect it with notions of optimality. Concluding chapters examine controller design via optimization, offering a mathematical approach that is useful for multivariable systems.

A comprehensive introduction to the tools, techniques and

Applications of convex  
optimization.

Introduces machine learning and its algorithmic paradigms, explaining the principles behind automated learning approaches and the considerations underlying their usage.

New and classical results in computational complexity, including interactive proofs, PCP, derandomization, and quantum computation. Ideal for graduate students.

This book provides a systematic in-depth analysis of nonparametric regression with random design. It covers almost all known estimates. The emphasis is on distribution-
