Life-Cycle Analysis and  
Calculating Embodied Energy  
Embodied energy is the total  
energy required for the  
extraction, processing,

of buildings. Unlike the  
life cycle assessment, which  
evaluates all of the impacts  
over the whole life of a

embodied energy only  
considers the front-end  
aspect of the impact of a  
building material.

The dictionary of energy defines 'embodied energy' as "the sum of the energy requirements associated, directly or indirectly, with the delivery of a good or service" (Cleveland & Morris, 2009). In practice however there are different ways of defining embodied energy depending on the chosen boundaries of the study.

to produce any goods or services, considered as if that energy was incorporated or 'embodied' in the product itself. The concept can be useful in determining the effectiveness of energy-producing or energy saving devices, or the "real" replacement cost of a building, and, because energy-inputs usually entail greenhouse gas emissions, in deciding whether a product contributes to or mitigates global warming. One fundamental purpose for measuring

The Embodied Energy and Carbon of Passive House Emergy is a measure of quality differences between different forms of energy. Emergy is an expression of all the energy used in the work processes that generate a product or service in units of one type of energy. Emergy is measured in units of emjoule s, a unit referring to the available energy consumed in transformations.

Emergy - Wikipedia

Embodied energy is the total energy required for the extraction, processing, manufacture and delivery of building materials to the building site. Energy consumption produces CO<sub>2</sub>, which contributes to greenhouse gas emissions, so embodied energy is considered an indicator of the overall environmental impact of building materials and systems.
