One aspect of the tectonic history that is of overriding significance to the geological development of the London Basin, and consequently to the application of London's geology to engineering and water supply, is the location of a broad tectonic boundary running approximately east to west beneath the London Basin . It originates from movements in the Variscan orogeny during and after the Carboniferous and is likely to have been reactivated periodically ever since as a line of crustal weakness.

Polje, (Serbo-Croatian: “field”), elongated basin having a flat floor and steep walls; it is formed by the coalescence of several sinkholes. The basins often cover 250 square km (about 100 square miles) and may expose “disappearing streams.” Most such basins have steep enclosing walls that range from 50 to 100 m (165 to 330 feet) in height, giving rise to the name “blind valley.”

Geology of Berkshire. Berkshire lies to the west of London and the scenery varies from chalk downlands in the north and west to lower lying gently undulating Palaeogene and younger strata in the south and east of the county. Geological history. The oldest rocks proved in the region are steeply dipping Ordovician and Silurian sediments.

BGG - Berkshire Geology

This is the Great Basin, part of the Basin and Range Province, of North America, a high desert defined by rows of mountains that run roughly north to south, stretch marks on the Earth’s crust. The parallel lines of mountains that define the basin also make it prone to earthquakes, such as the large magnitude 6.0 earthquake that rattled Wells, Nevada, on February 21, 2008.
